

# What Our Customer's Are Saying:

Our facility operates 24/7, 363 days a year. The most critical process system in our facility utilizes a single hot oil heater. This system included obsolete combustion controls, that the original OEM vendor could no longer support. Fireeye was contacted to address migration needs for these legacy controls to a more current technology. The project was complicated due to the integration required with existing flame safety equipment. Of primary concern was process downtime, with only a series of planned maintenance shutdowns available for equipment conversion.

Fireeye's support in terms of preliminary system engineering, startup and commissioning, and maintenance issues have proven invaluable. Not only has the equipment performed according to plan, but the installed system has also been simpler to maintain with transparent conversion for operations personnel. As our facility continues to expand, Fireeye will play a key role in future additions including a standby hot oil heater.

I highly recommend Fireeye based upon positive experience. Field service engineering and factory support have continued to meet our needs well after the successful completion of the project. This commitment is in contrast to many vendors in the market today, and establishes Fireeye as a key supplier for flame safety, combustion controls, and associated equipment.
